# 25 Years of Quasar Microlensing

## - Introduction -

- microlensing is ubiquitous: in lensed quasars and at this meeting:
- 8 out of 30 talks here have “microlensing” in title
- in almost ALL talks, “microlensing” was mentioned (occasionally in the negative form “no microlensing” ...)

# Quasar Microlensing

- What is (quasar) microlensing?
- What can be learned from microlensing?
  - attempts?
  - detections?
  - limits?
- What are the prospects for future detections?

# What is microlensing?

- effects of “**compact**” objects with “**small**” masses along the line of sight to distant sources
- what is “**compact**”?
- what is “**small**”?

# What is microlensing?

- effects of “**compact**” objects with “**small**” masses along the line of sight to distant sources
- what is “**compact**”?  
much smaller than the Einstein radius!
- what is “**small**”?  
Einstein radius below resolution limit!

# What is microlensing?

- effects of “**compact**” objects with “**small**” masses along the line of sight to distant sources
- what is “**compact**”?  
much smaller than the Einstein radius!
- what is “**small**”?  
Einstein radius below resolution limit!

Einstein radius:

( $z_L = 0.5, z_S = 2.0$ )

$$r_E = \sqrt{\frac{4GM}{c^2} \frac{D_S D_{LS}}{D_L}} \approx 4 \times 10^{16} \sqrt{M/M_\odot} \text{ cm.}$$

Einstein angle:

$$\theta_E = r_E/D_S \approx 10^{-6} \sqrt{M/M_\odot} \text{ arcsec}$$

•

- what mass range?  $10^{-6} < m/M_\odot < 10^6$

(or: nanolensing, mesolensing, millilensing)

# How do I know that quasar variability is due to microlensing?

(... rather than a physical variation of the quasar ...)

**Problem: all quasars are variable (more or less ...)**

For an isolated quasar:

- (almost) impossible to distinguish "intrinsic" variability from "extrinsic" (i.e. microlens-induced) variability!

For a double/multiple quasar:

- intrinsic variability shows up in ALL images, after certain time delay!  
⇒ shift and subtract lightcurves:  
"difference" lightcurve: flat - no microlensing  
variable - microlensing

# Quasar Microlensing

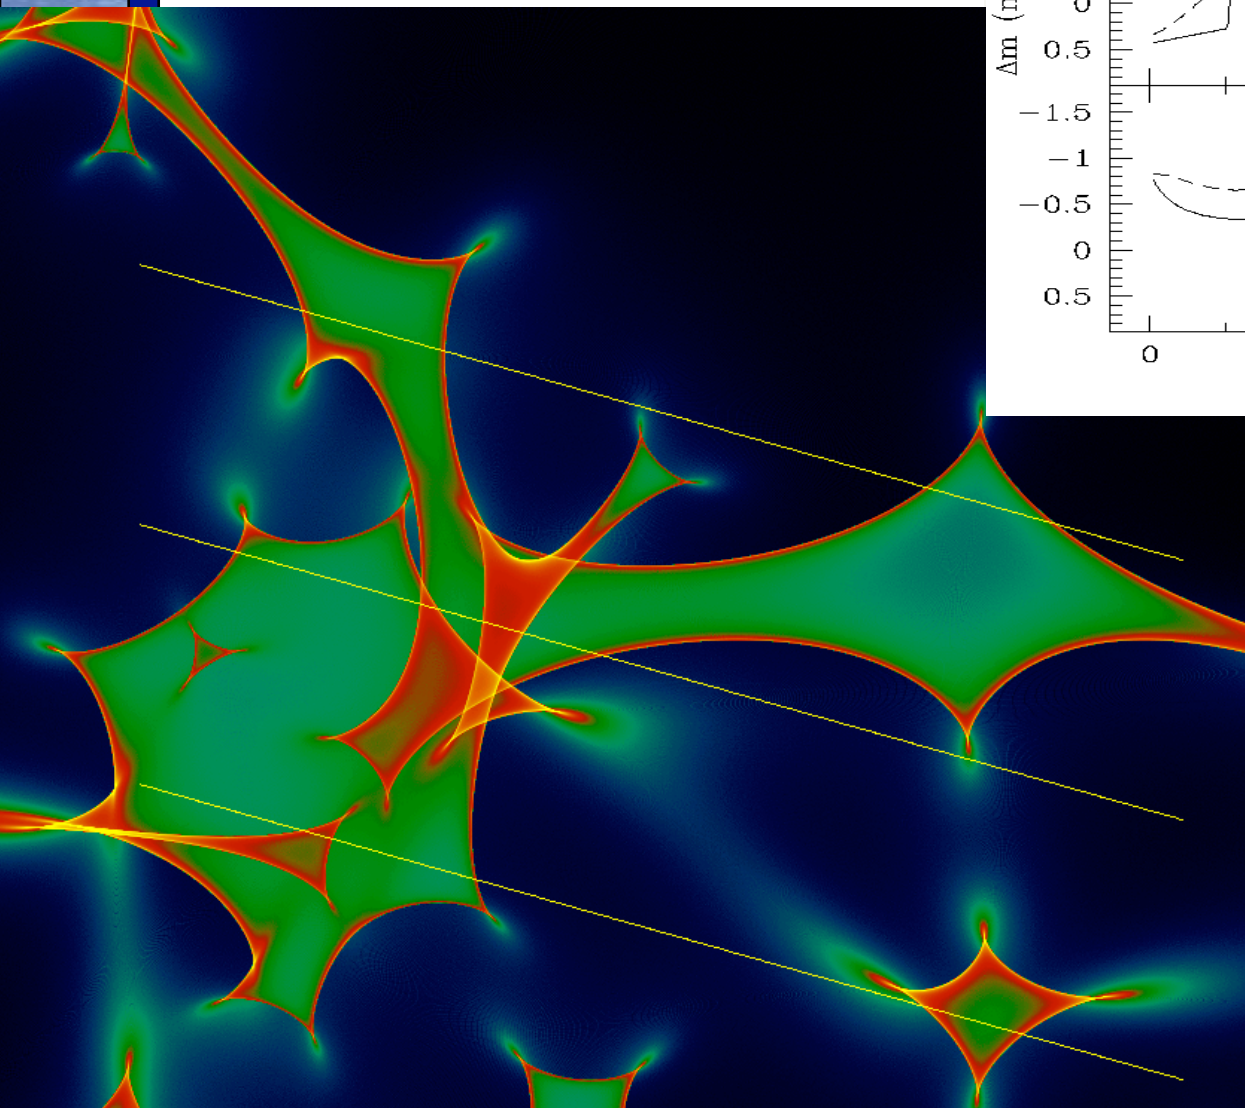

25 Years of Quasar Microlensing: Introduction  
in: »25 years after the discovery: Some current topics of lensed QSOs«,  
Joachim Wambsganss (Universität Heidelberg)  
Santander, December 17, 2004

# Quasar microlensing

# How to detect microlensing?

## • Statically

- Intensity ratios in optical disagree with models and/or those of radio/emission lines

## • Dynamically

- non-intrinsic variability
- apparent motion of light centroid

•

## • Generic problem / very important:

- for detection/understanding of microlensing: time delay must be measured, or known (!) to be very small (compared to time scale of measured fluctuations)

**“One man’s signal is another man’s noise!”**  
**(Paul Schechter)**

# How can we observe microlensing?

- changing magnification, line shape, position due to relative motion of source, lens and observer:  
microlensing is a **dynamic** phenomenon!
- photometrically
- spectroscopically
- astrometrically

# What are the expected time scales?

Einstein time:  
( $z_L = 0.5, z_S = 2.0$ )

$$t_E = r_E / v_{\perp} \approx 15 \sqrt{M / M_{\odot}} v_{600}^{-1} \text{ years}$$

Crossing time:

$$t_{cross} = R_{source} / v_{\perp} \approx 4 R_{15} v_{600}^{-1} \text{ months}$$

# The (pre)history of quasar microlensing

- (1979 Walsh et al.: Discovery of first gravitationally lensed quasar Q0957+561A,B )

25 Year Quasar Microlensing: Introduction  
in: »25 years after the discovery: Some current topics of lensed QSOs«,  
Joachim Wambsganss (Universität Heidelberg)  
Santander, December 17, 2004

# Quasar microlensing: The goals

- Quasar variability due to microlensing reveals:
  - Effects of compact/smooth matter along line of sight
  - Size of quasar
  - Two-dimensional brightness profile of quasar
  - Mass (and mass function) of lensing objects

# Quasar microlensing: The goals

- Quasar variability due to microlensing reveals:
  - Effects of compact/smooth matter along line of sight **detected!**
  - Size of quasar **partly!**
  - Two-dimensional brightness profile of quasar **not at all!**
  - Mass (and mass function) of lensing objects **some limits!**

# The quadruple quasar Q2237+0305

$z(\text{quasar}) = 1.695$ ,  $z(\text{galaxy}) = 0.039$   
image separation 1.7 arcsec (HST)

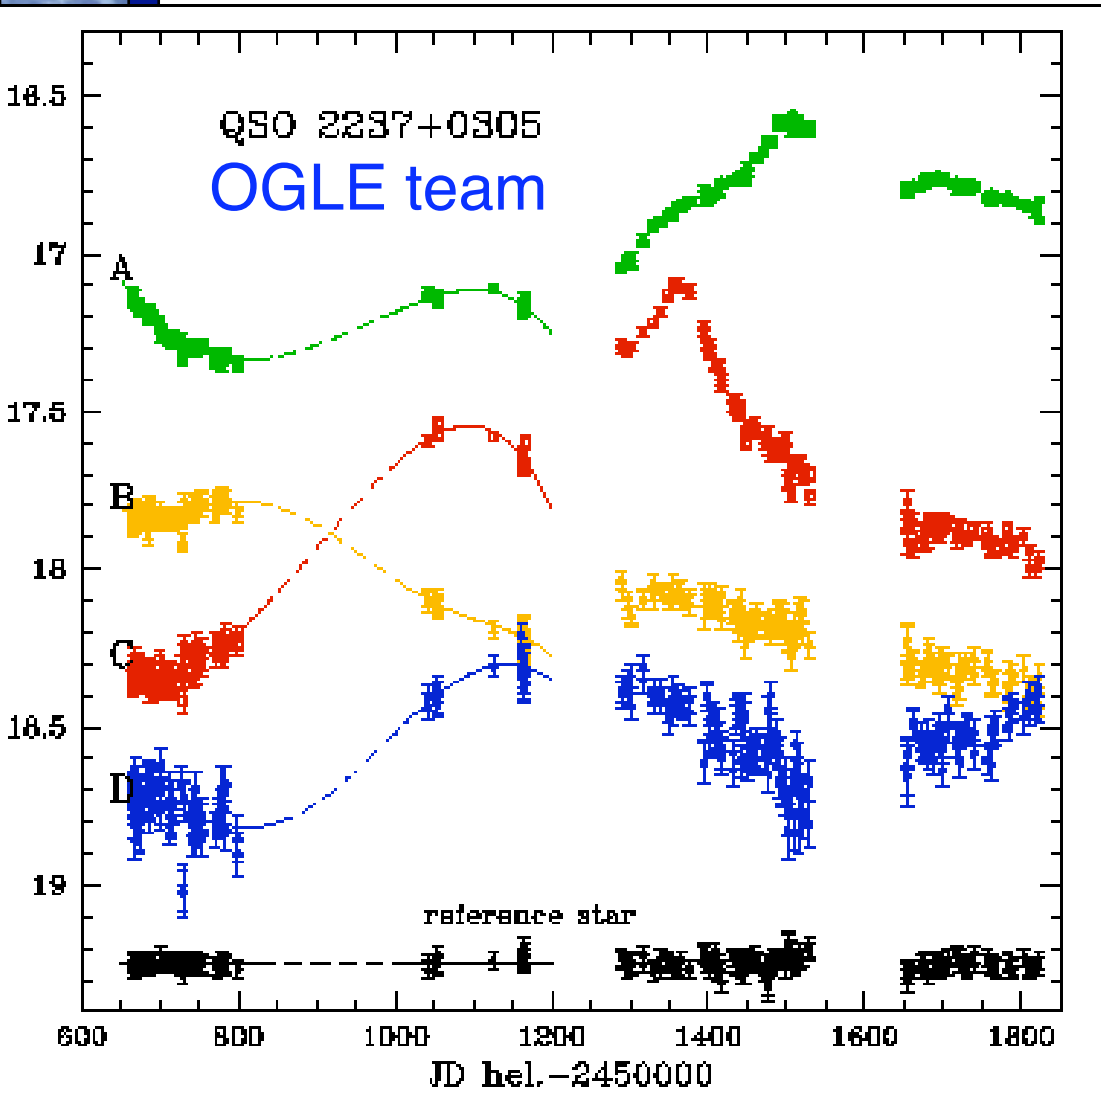

25 Years of Quasar Microlensing: Introduction

HUCHRA's LENS

Santander, Decembe

OGLE team

# Quasar Microlensing? Q0957+561

Kundic et al. (1997), Wambsganss et al. (2000)

25 Years of Quasar Microlensing: Introduction  
in: »25 years after the discovery: Some current topics of lensed QSOs«,  
Joachim Wambsganss (Universität Heidelberg)  
Santander, December 17, 2004

# Quasar Microlensing Simulation: Q0957+561

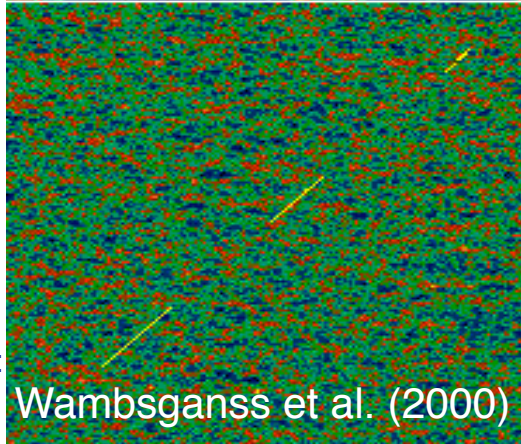

$10^{-1} M_{\odot}$

$10^{-3} M_{\odot}$

$10^{-5} M_{\odot}$

in:  
Wambsganss et al. (2000)

# Quasar Microlensing Results: Q0957+561

Halo of lensing galaxy **cannot** consist entirely of compact objects (MACHOs) in certain mass ranges (Wambsganss et al. 2000)

**More systems, longer baseline**  
**⇒ better constraints!**

# OGLE monitoring of HE1104-1805: Microlensing of (relativistically moving) knots

(Schechter et al. 2003)

# OGLE monitoring of HE1104-1805: Microlensing of (relativistically moving) knots (Schechter et al. 2003)

data points for 102 separate nights in three years:

both images show fluctuations, but with substantial differences when correcting for time delay

short time scale (4 weeks) requires relativistic motion of one or more components of source (knots?)

dark matter? not necessarily ...

HE1104-1805 (Courbin et al. )

# Microlensing by cosmologically distributed lensing objects of stellar mass?!

Dalcanton et al. (1994):

- microlensing of objects between  $0.001 M_{\odot}$  and  $100 M_{\odot}$  will MAGNIFY continuum regions of quasars
  - ⇒ reduce apparent equivalent widths (EW)
  - ⇒ increase of small EW quasars with  $z$
  - ⇒ test: 200 QSOs
- effect NOT observed ⇒ limits on  $\Omega$ , no significant DM
- $\Omega (0.001 M_{\odot} - 20 M_{\odot}) < 0.1$
- needs to be REDONE!!!

# Quasar Microlensing at high magnification: suppressed saddlepoints and the role of dark matter

PG1115+080:  
0.48",  $\Delta m = 0.5$  mag  
(Weymann et al. 1980)

SDSS0924+0219:0.66",  
 $\Delta m = 2.5$  mag (Inada et al. 2003)

# Quasar Microlensing at high magnification: suppressed saddlepoints and the role of dark matter

MG0414+0534:

close pairs of bright images:  
they should be "about"  
equal in brightness

they are not!

saddle point image  
demagnified!

at least 4 similar systems

what's going on?!?

ML, substructure, DM ?

# Astrometric microlensing of quasars

(Treyer & Wambsganss 2004)

- center-of-light of quasars moves during microlensing event:
  - effect depends on size of quasar  $\Rightarrow$  measurable
  - effect depends on mass of lenses  $\Rightarrow$  measurable
  - ... and on surface mass density/external shear: strongest for “interesting cases” with  $\kappa = \gamma \approx 0.4$
- this centroid shift is correlated with magnification changes
- the “jumps” can easily reach few Einstein radii, for Q2237+0305 this is of order 15 to 35 microarcsec
- great opportunity for detection with SIM, VLTI, GAIA in not-to-distant future !

# Quasar microlensing: The future goals

- Quasar variability due to microlensing reveals:
  - Effects of compact/smooth matter along line of sight
  - Size of quasar
  - Two-dimensional brightness profile of quasar
  - Mass (and mass function) of lensing objects

# Quasar microlensing: The future goals

- Quasar variability due to microlensing reveals:
  - Effects of compact/smooth matter along line of sight  
**Detect/monitor ML in more systems!**
  - Size of quasar  
**Go for it!**
  - Two-dimensional brightness profile of quasar  
**ML is unique tool for this!**
  - Mass (and mass function) of lensing objects  
**Just do it!**
