# Gravitational lens system SBS 1520+530 and its neighbourhood

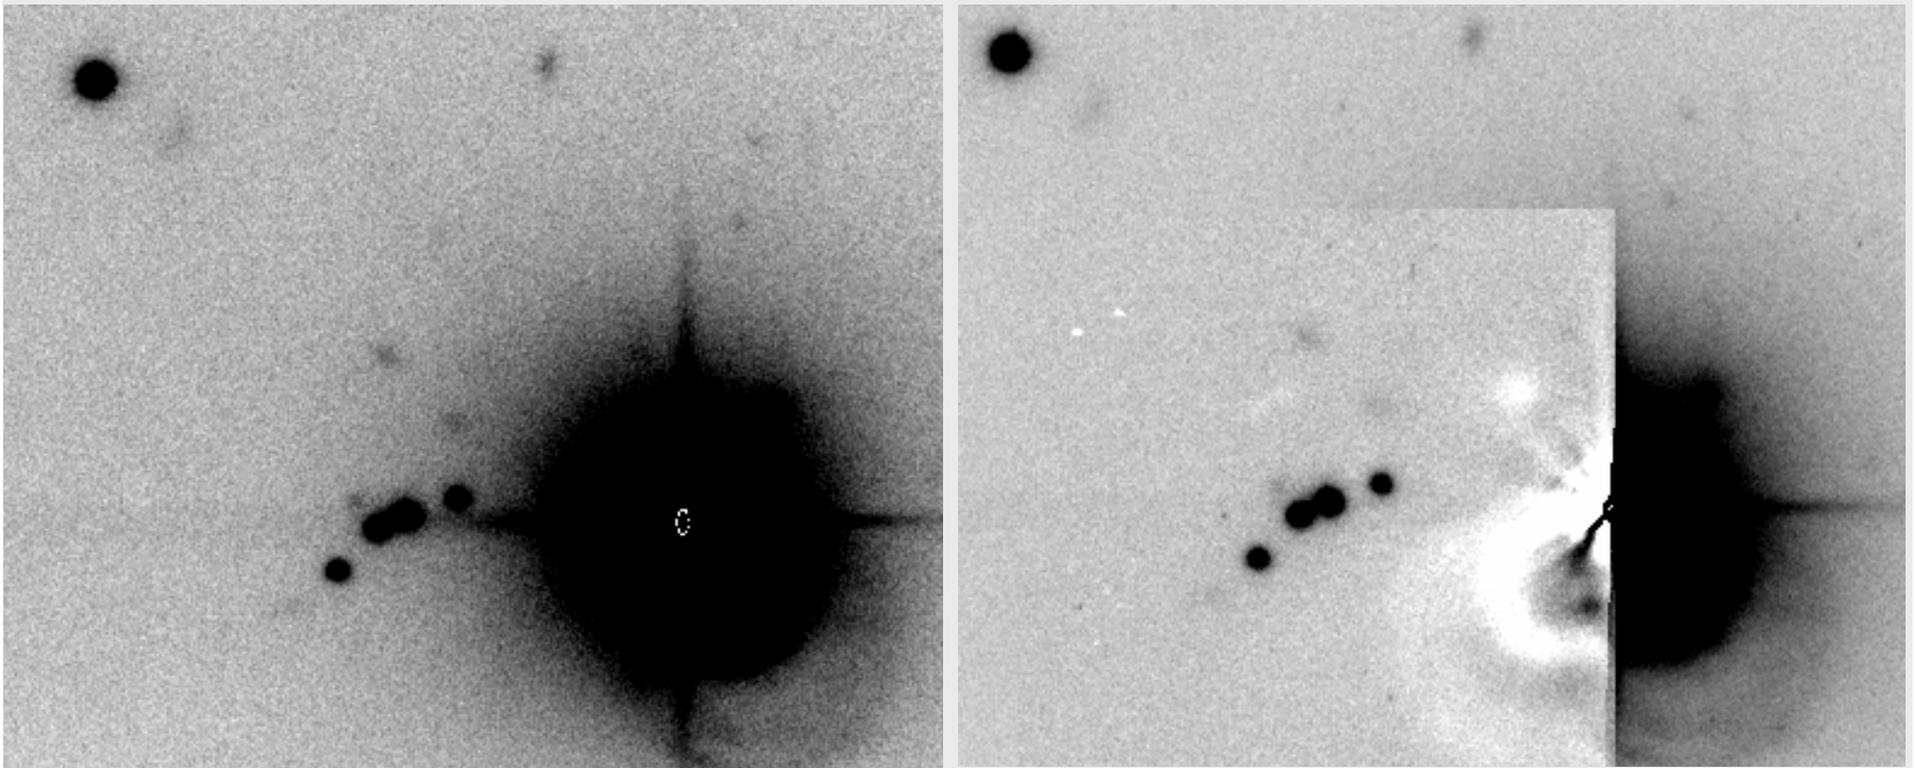

AZT-22 at Maidanak Observatory

# Designation of objects in the field of SBS 1520+530

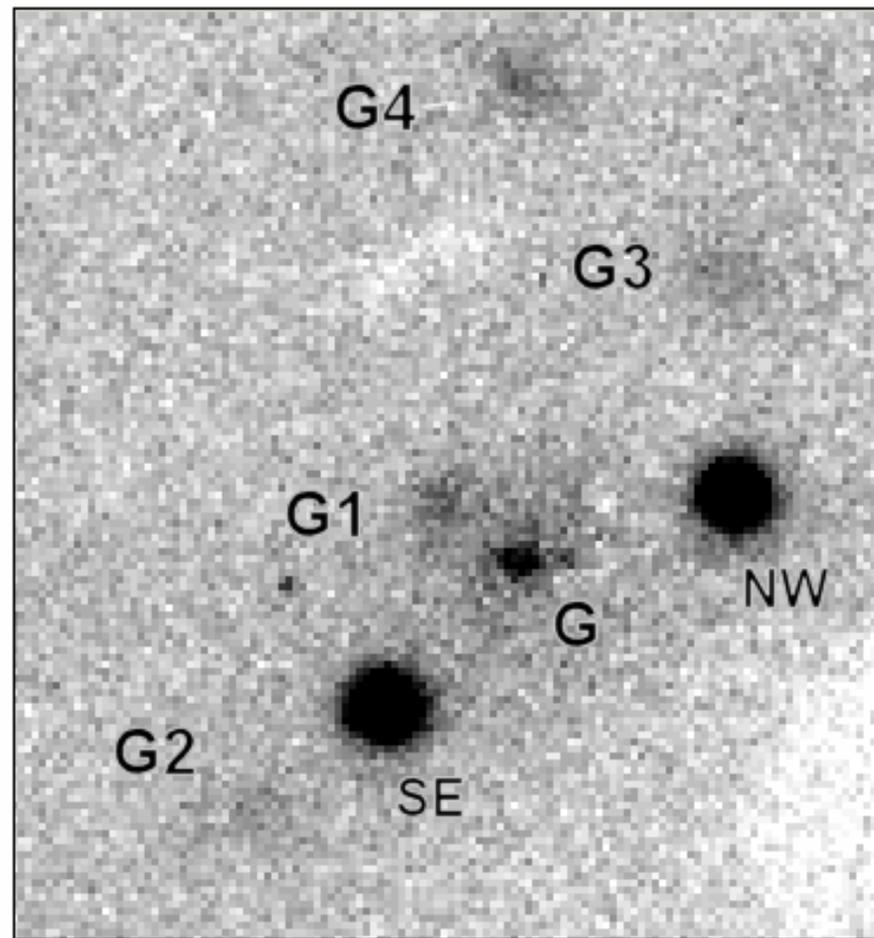

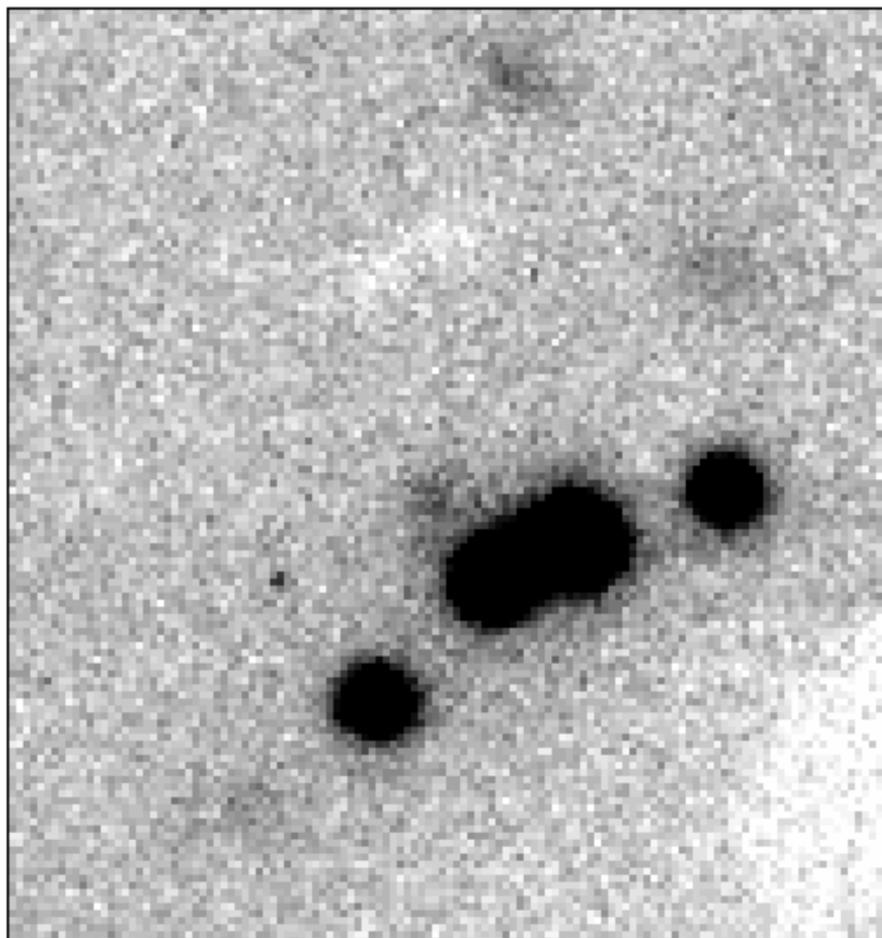

Photometry of reference star S1

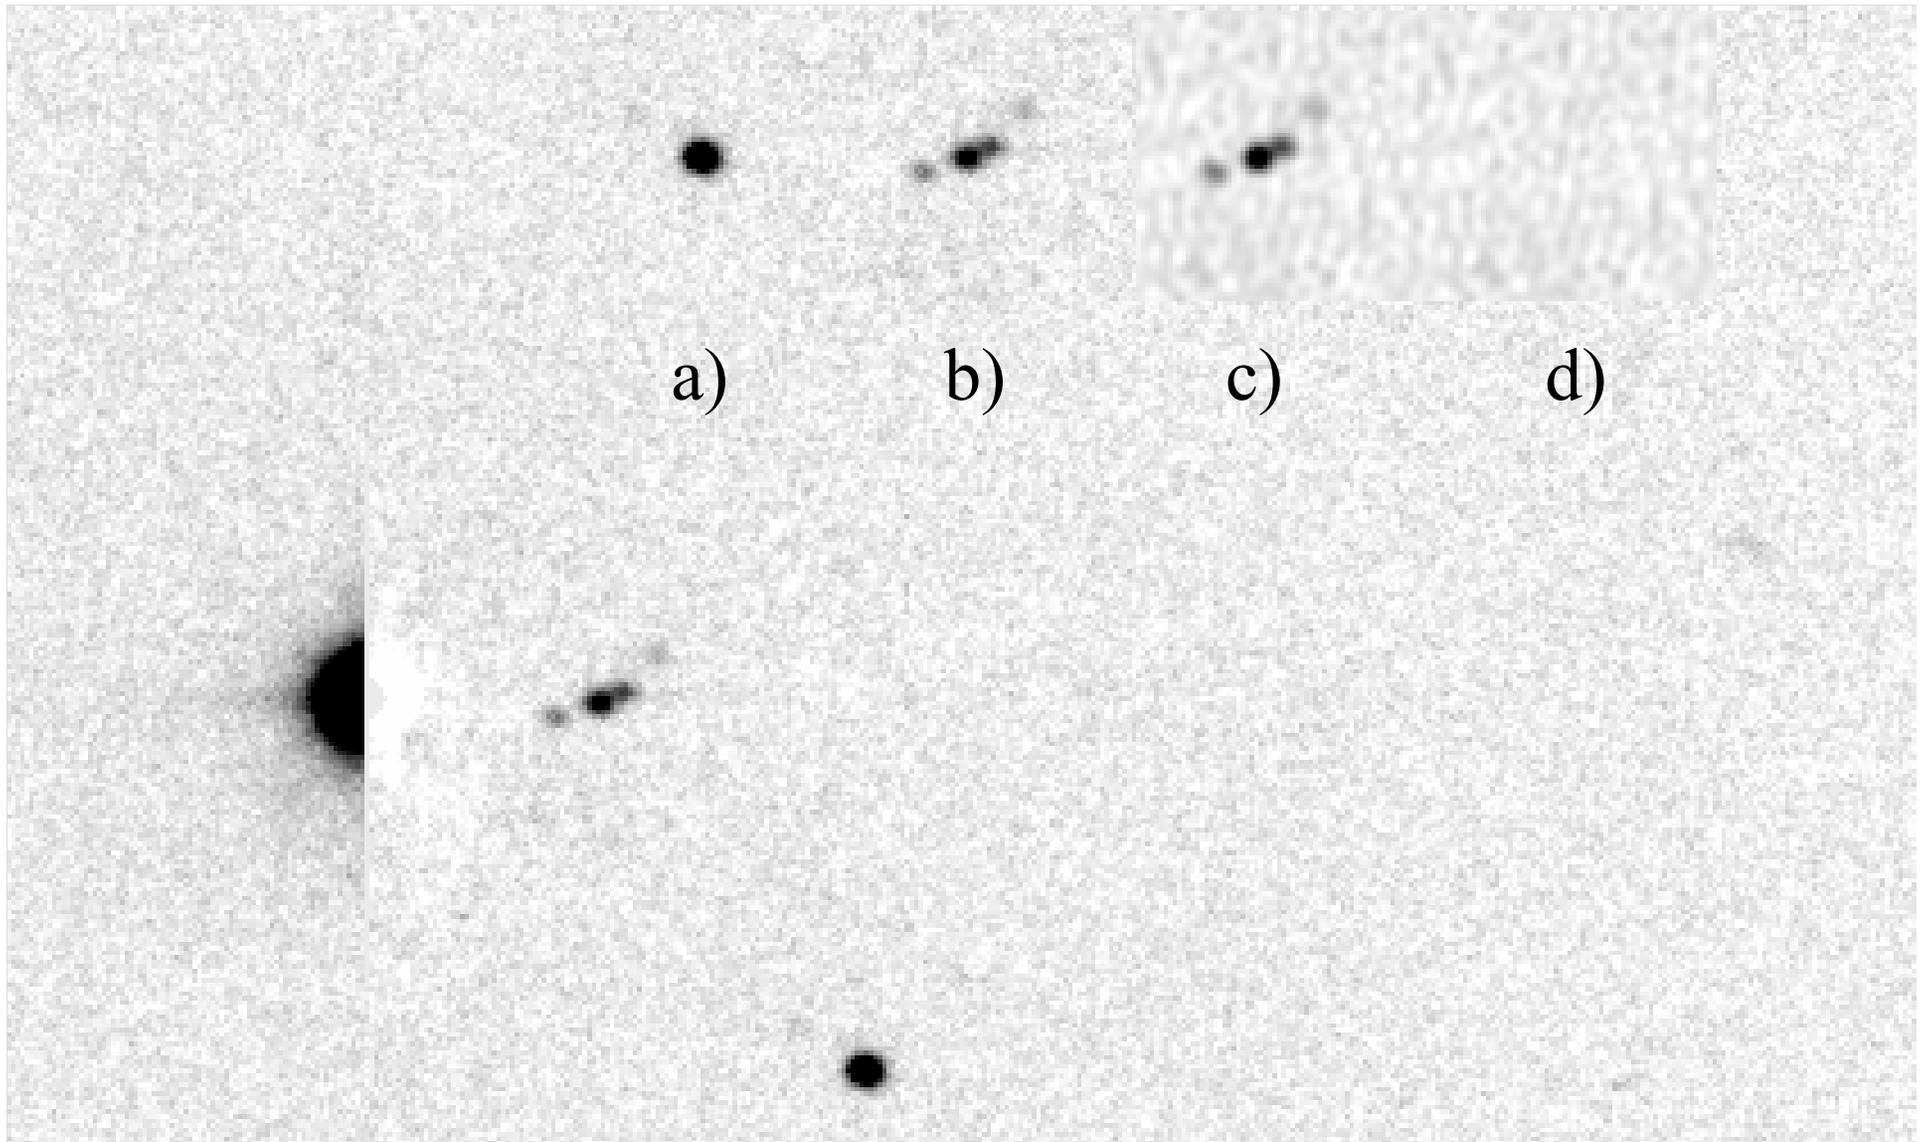

- $B=17.80^m \pm 0.03^m$
- $V=17.37^m \pm 0.02^m$
- $R=17.18^m \pm 0.02^m$
- $I=16.93^m \pm 0.02^m$

*Left:* averaged image of SBS1520+530 in I band (sum of 38 images with 300 s exposure each, seeing FWHM=0.65" ); diffraction rays and scattered light from close neighboring bright star is seen; image cuts are chosen to contrast background variations. *Right:* the same image after applying procedures of diffraction rays subtraction and correction for the scattered light.

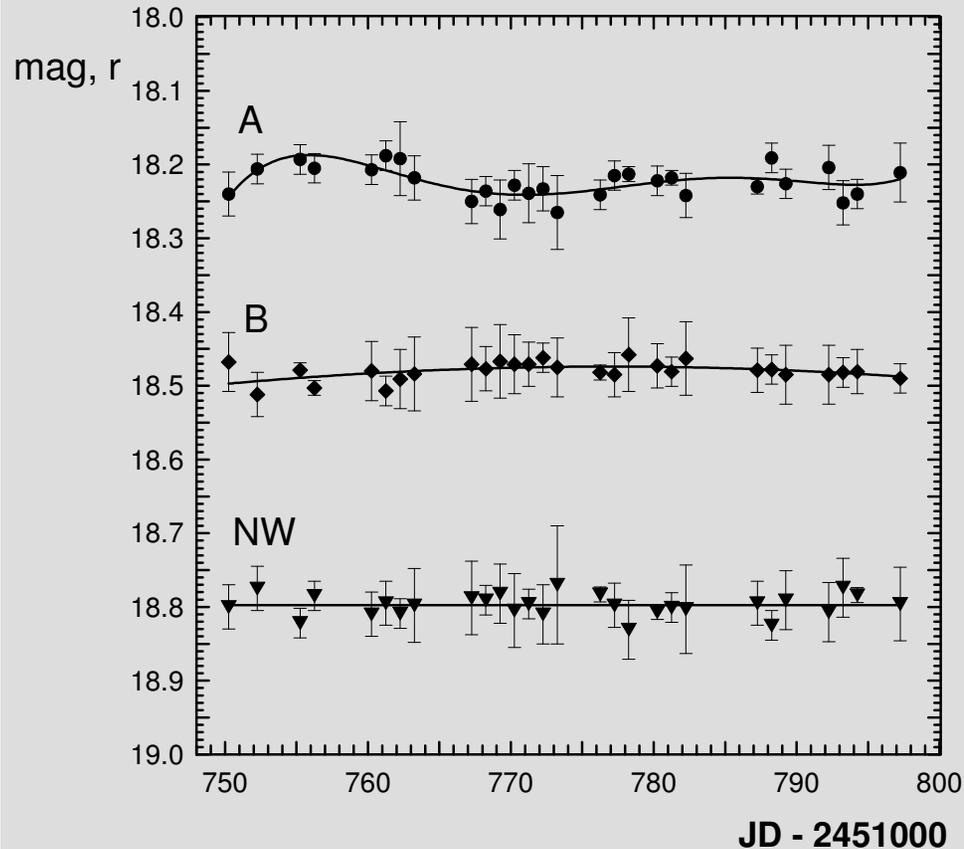

*Right:* A fragment of averaged image of SBS1520+530 in I band with diffraction rays and scattered light from the close bright star corrected. *Left:* The same image with A and B components subtracted. The lensing galaxy is denoted as G, neighboring field galaxies -as G1-G4

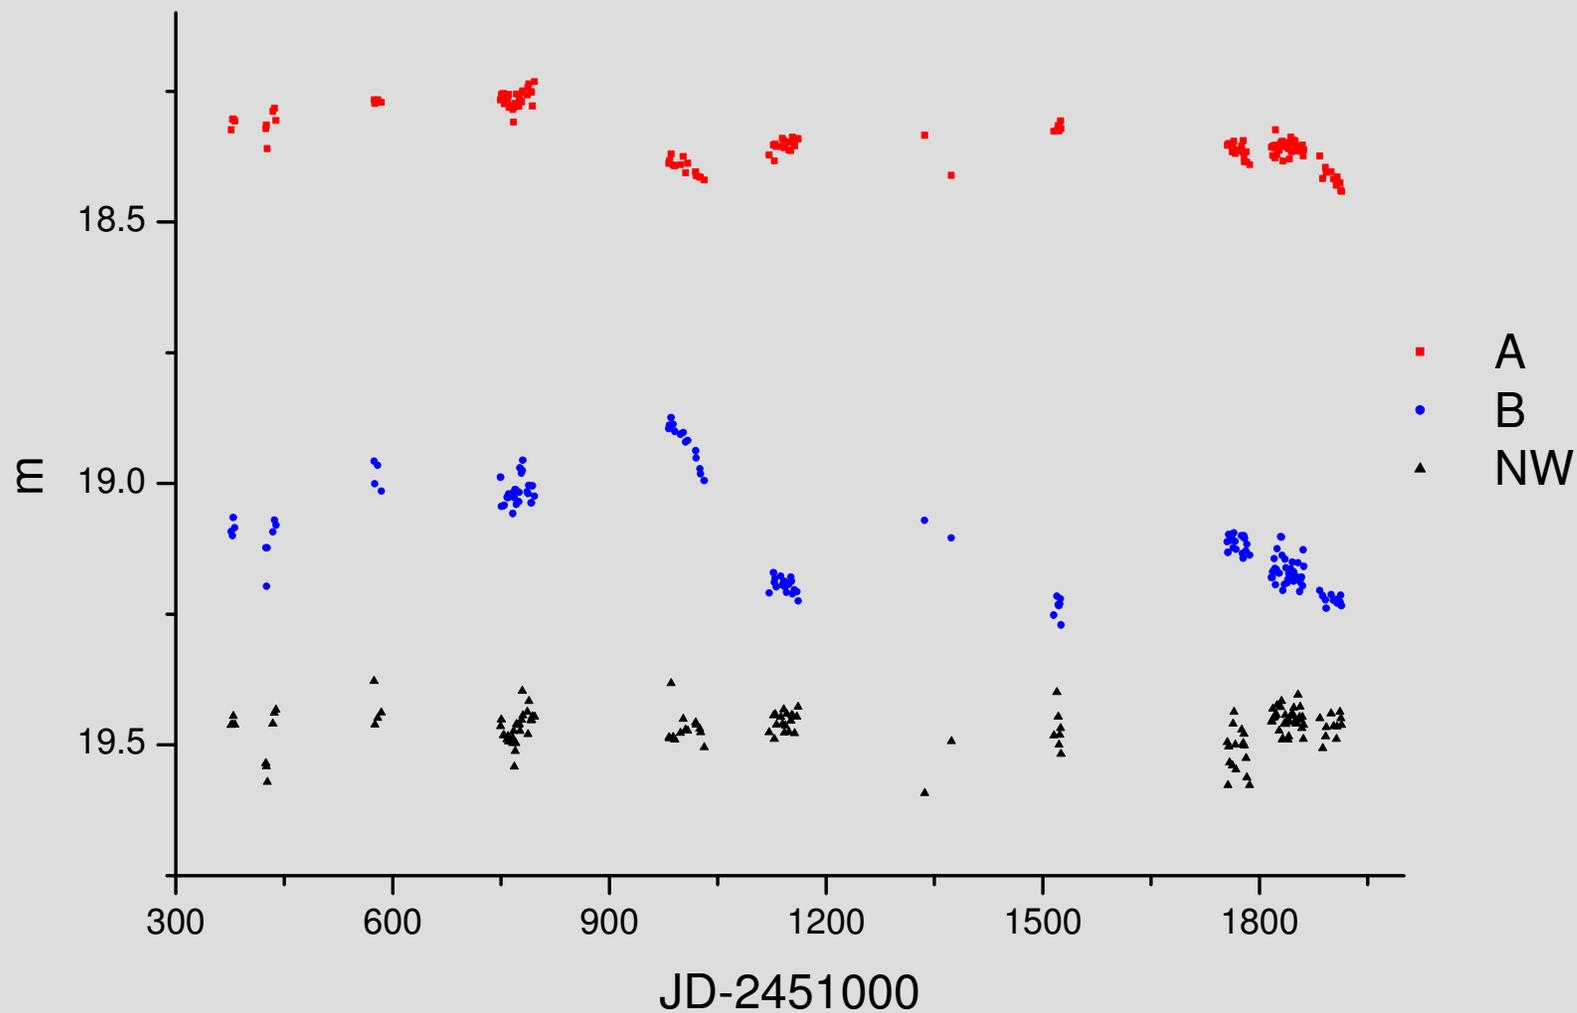

The work of the photometry routine: a) PSF Star; b) an initial image of object; c) the same image after applying a restoration procedure d) the result of subtraction of

# The continuous monitoring (each clear night) in 2000

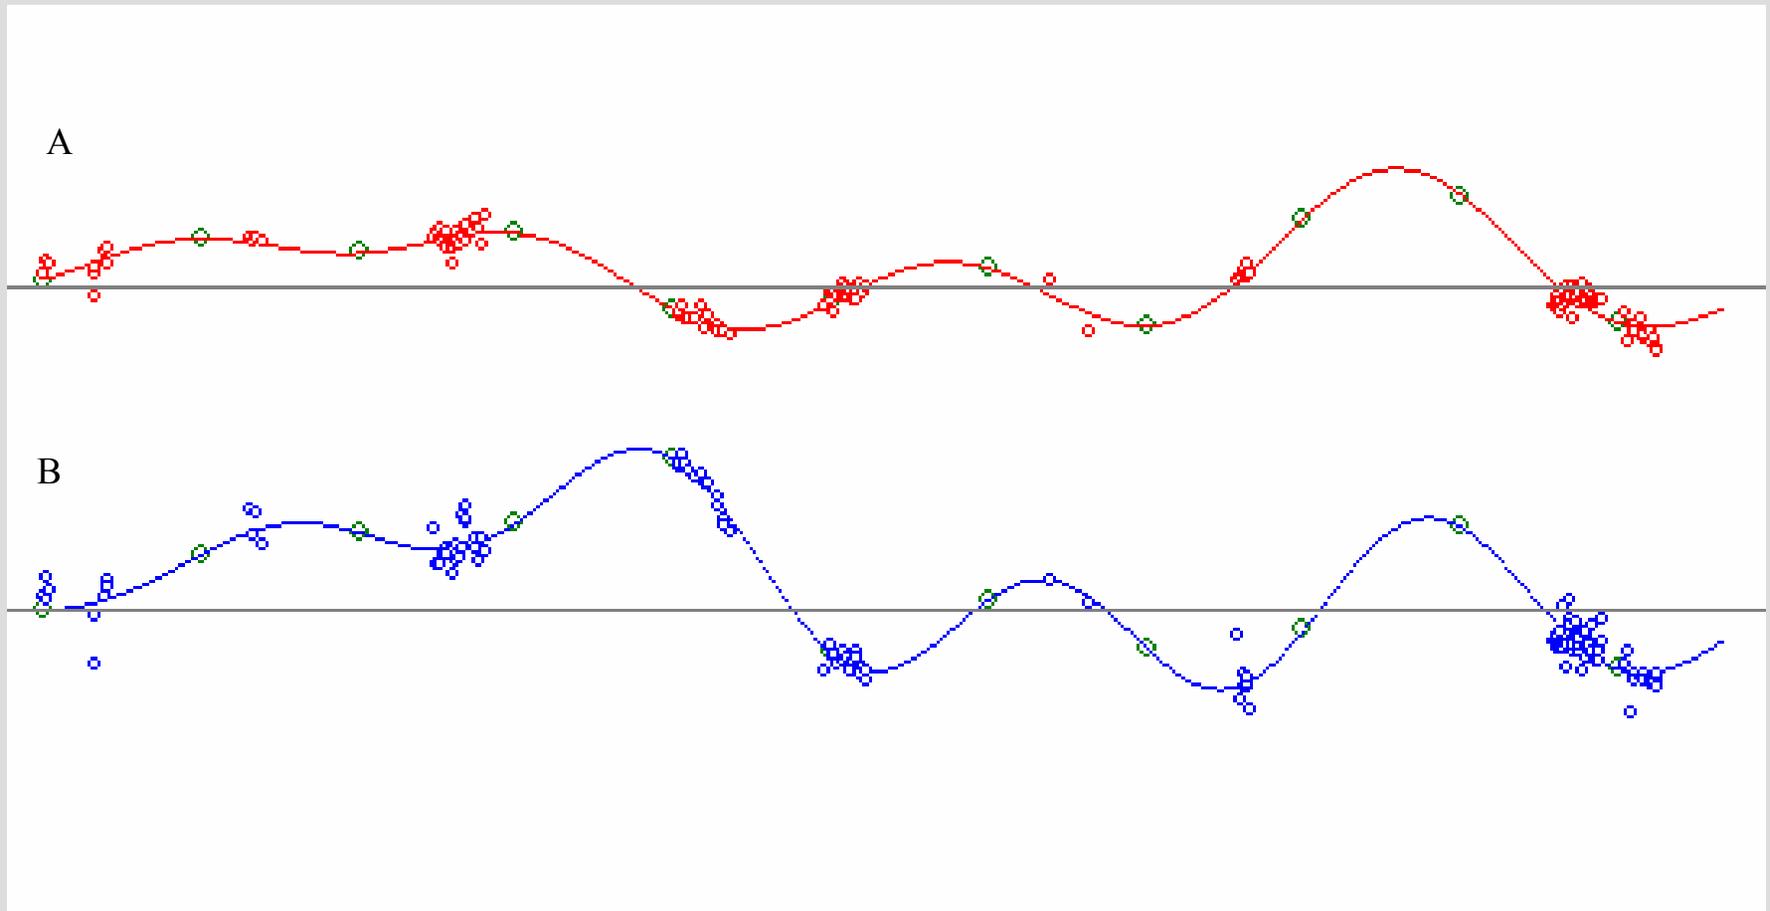

The variability of a component **A** on an interval of order of 10 days and amplitude 0.03m-0.05m is detected

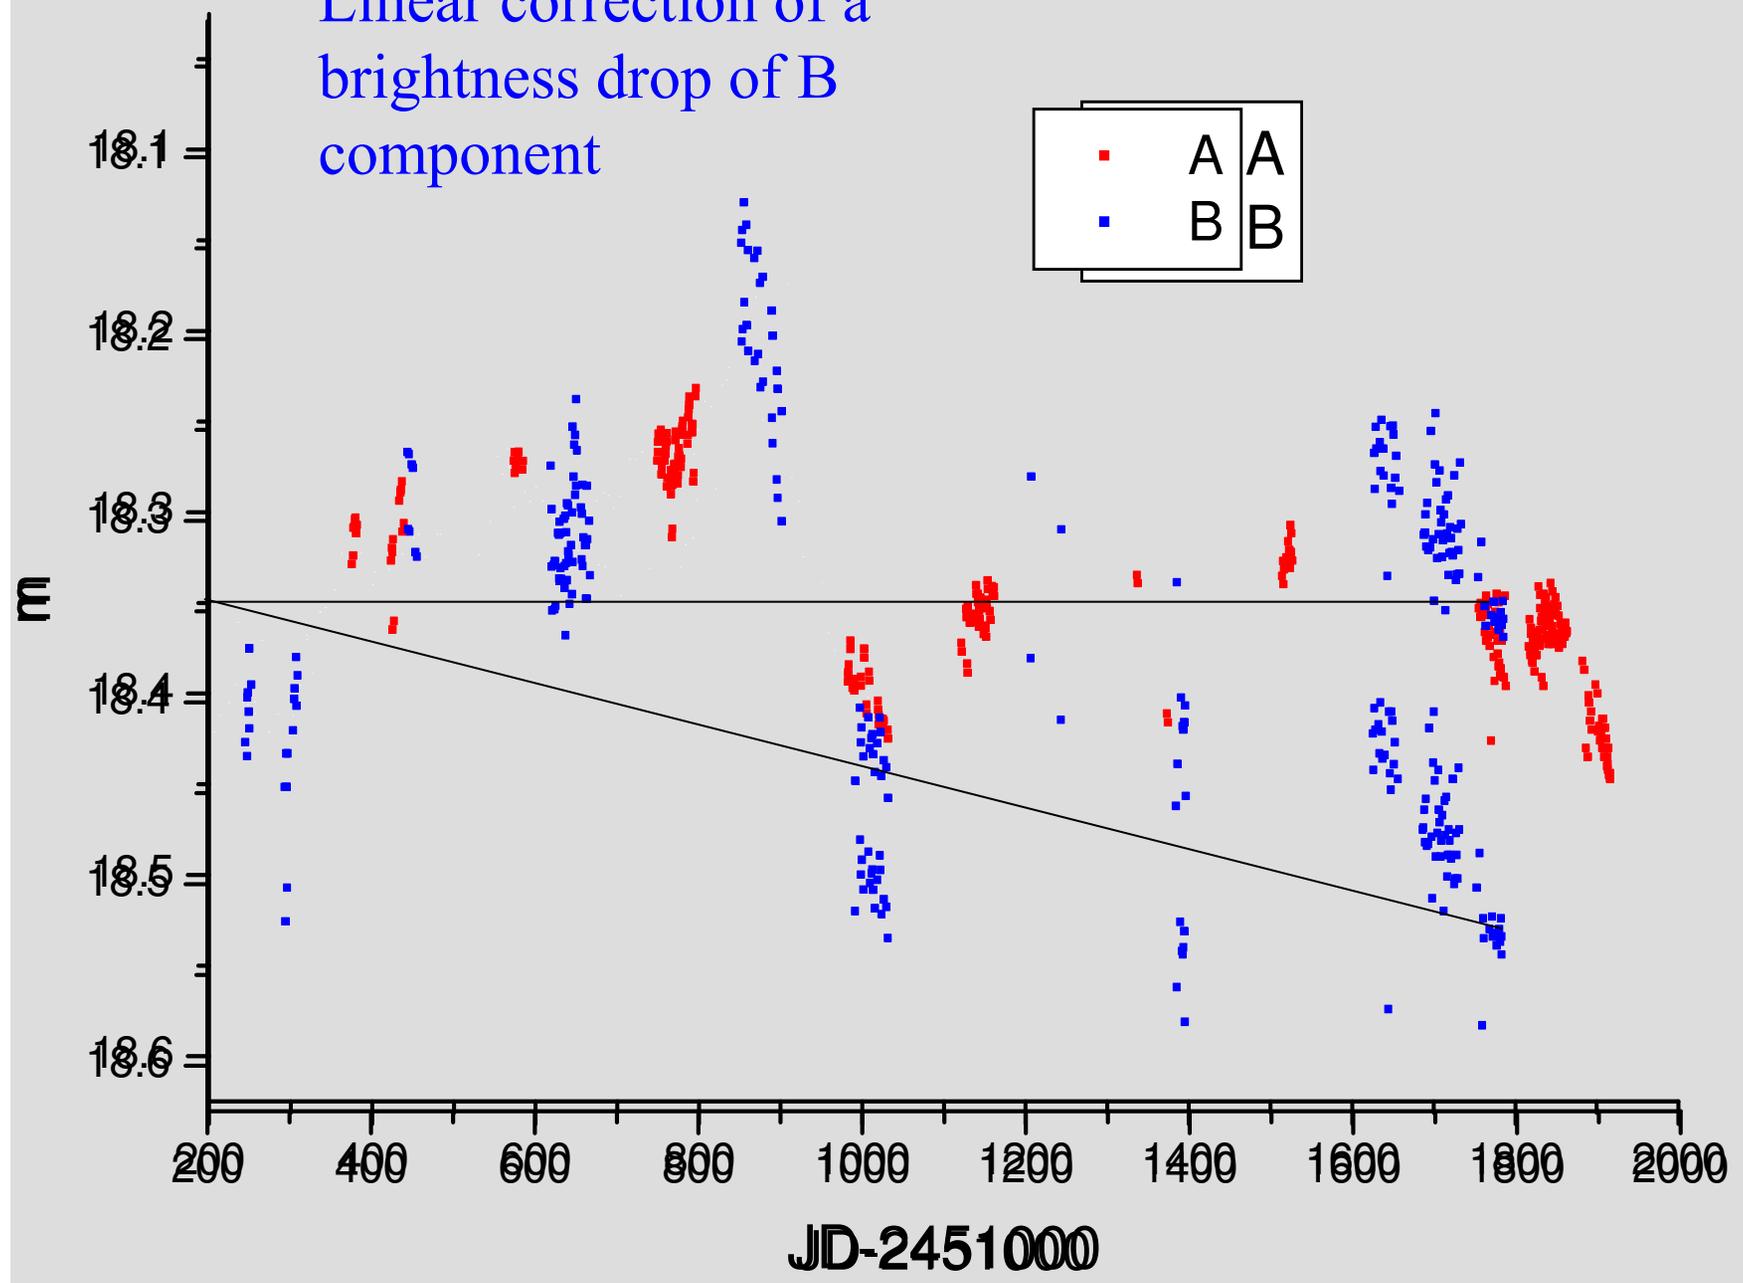

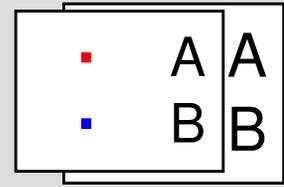

Historical light curves A,B components of SBS1520+530 and the star NW, including all the data obtained at Maidanak Observatory during 1999-2003.

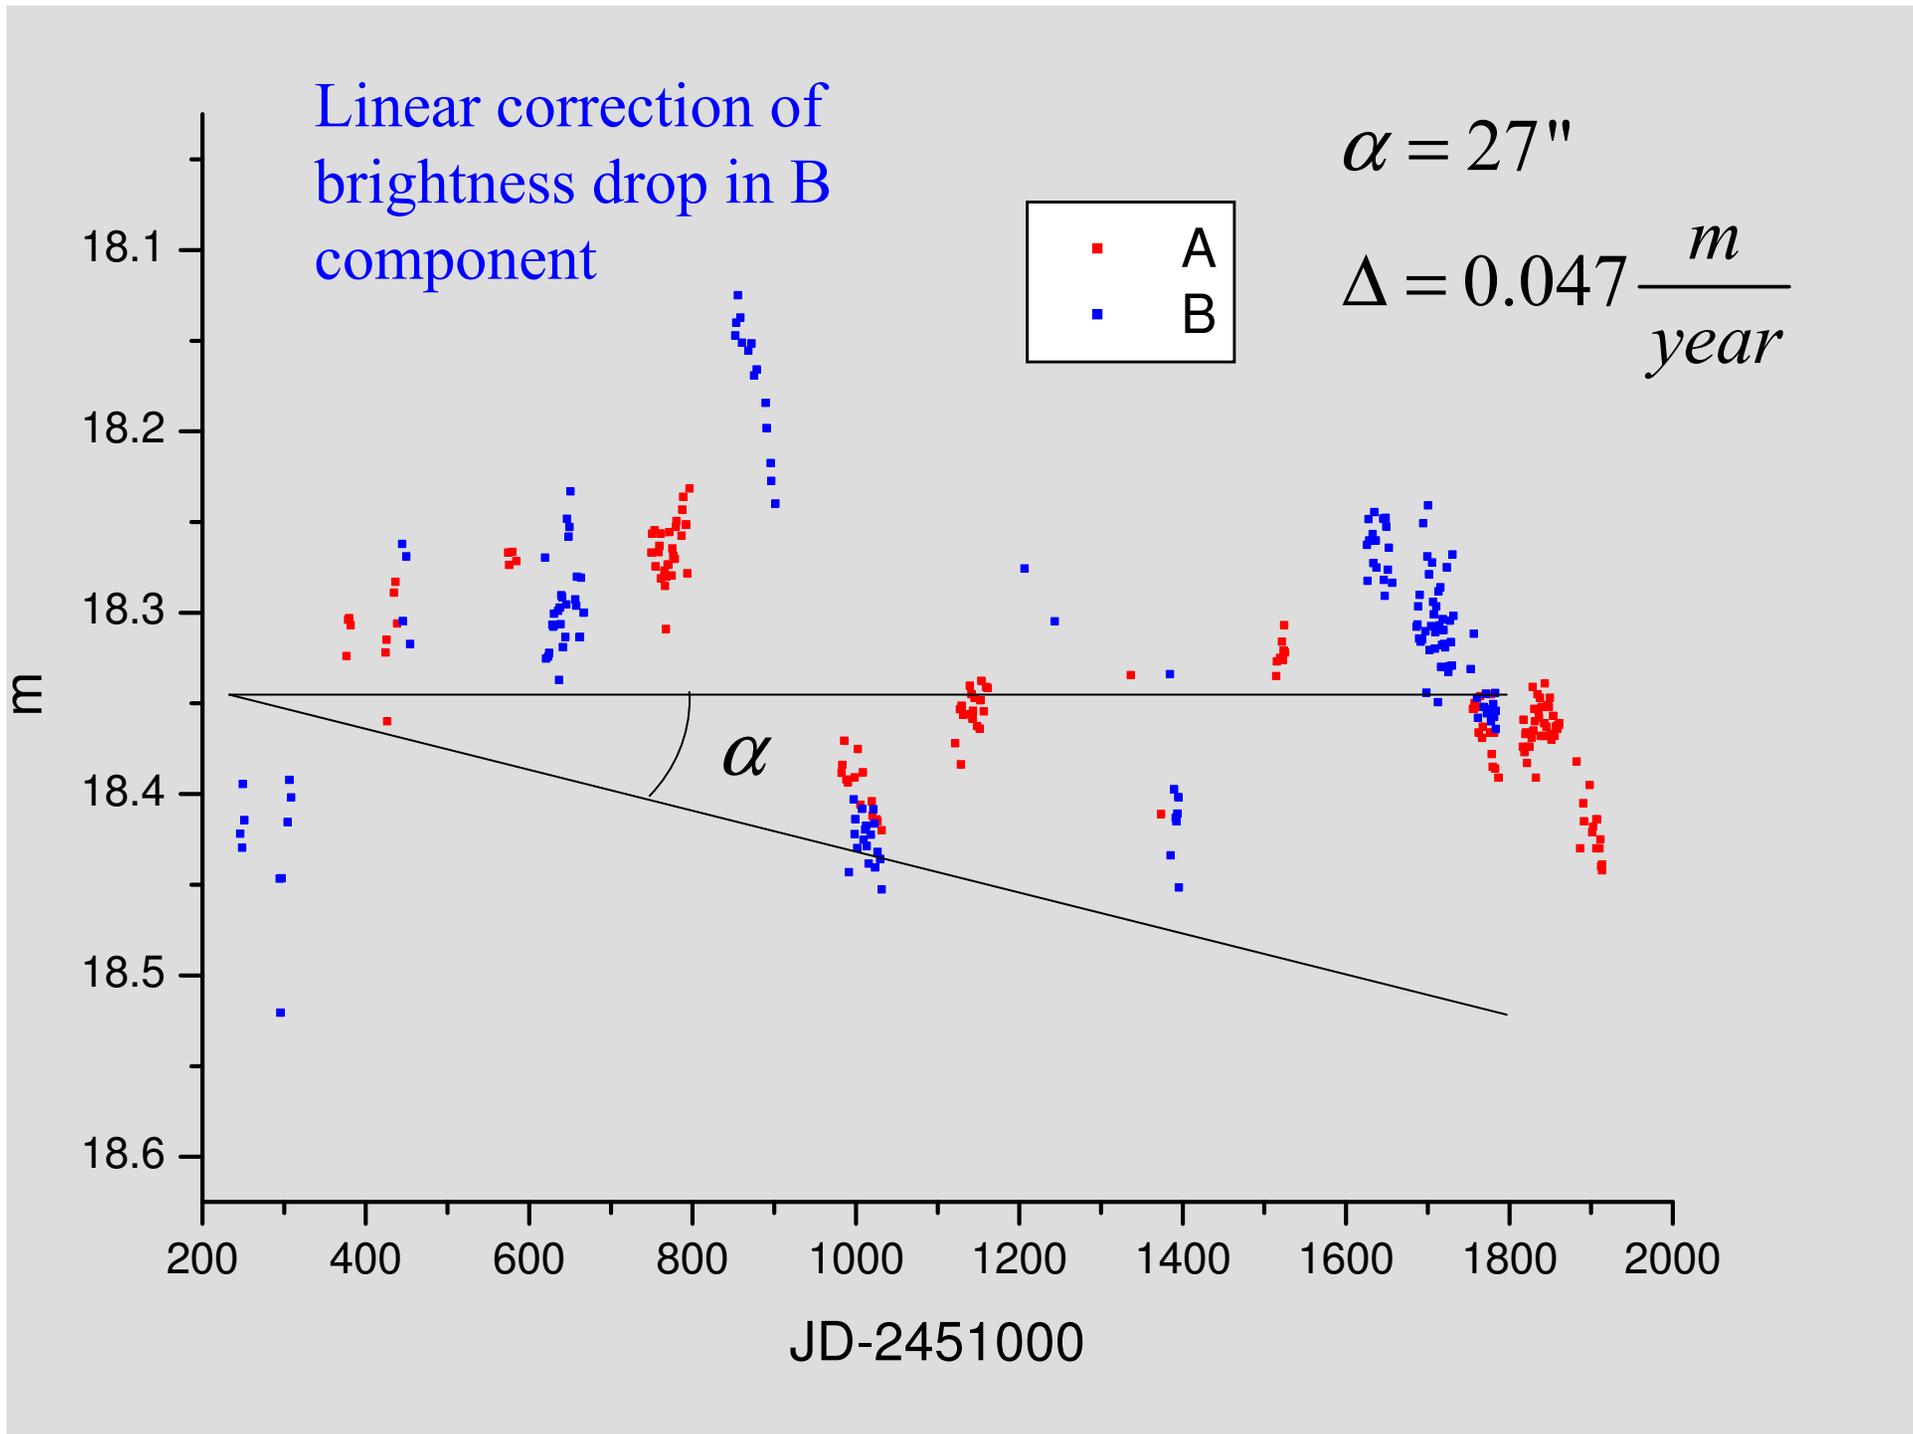

# Fitting of a light curves of quasar components with a window equal 0.5 years

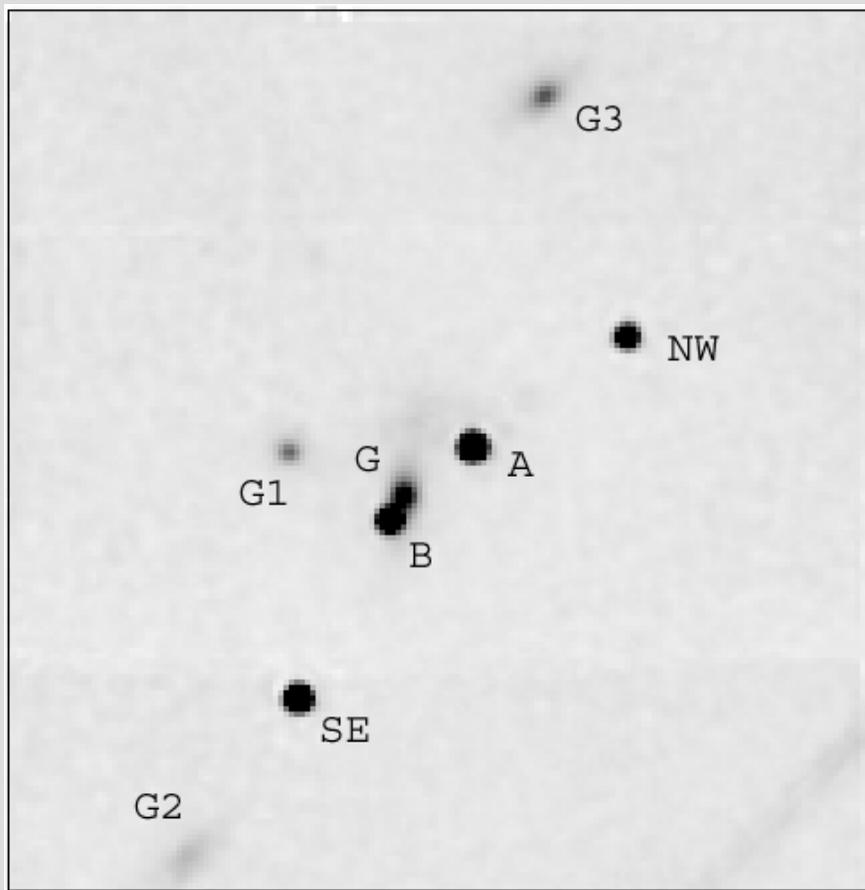

Linear correction of a  
brightness drop of B  
component

## Restored HST Image of SBS 1520+530

Measured relative coordinates  
of objects in SBS 1520+530  
relative to **A** :

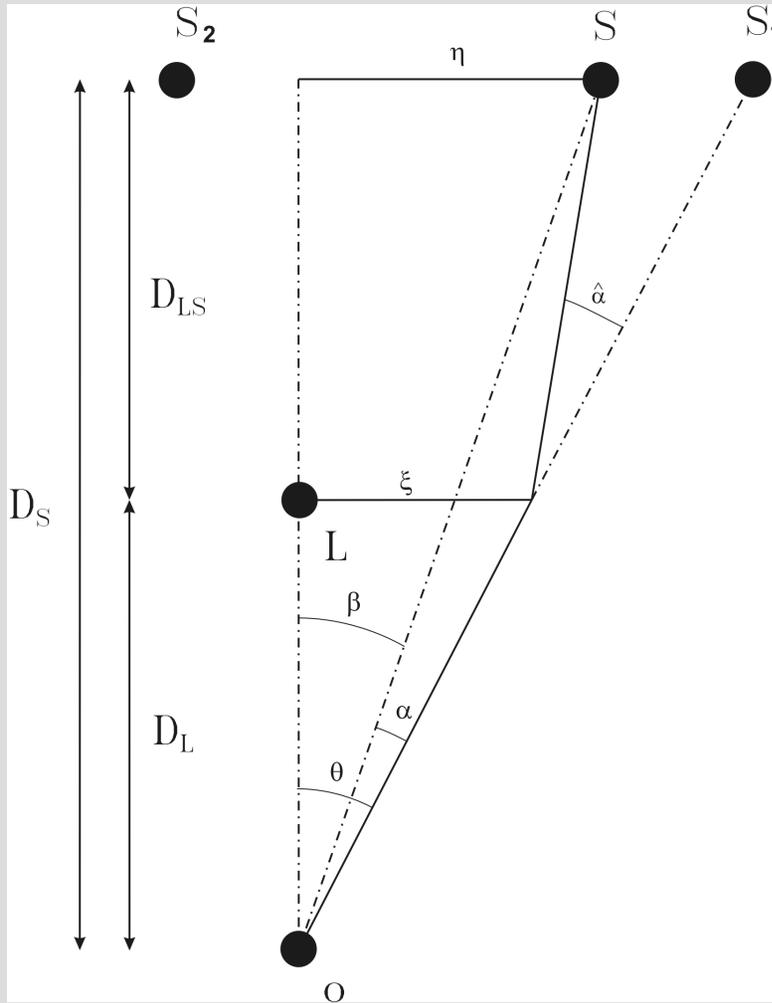

$$\begin{aligned} \mathbf{B} \quad \Delta\alpha &= 1.429'' \\ \Delta\delta &= -0.652'' \end{aligned}$$

$$\begin{aligned} \mathbf{G} \quad \Delta\alpha &= 1.141'' \\ \Delta\delta &= -0.395'' \end{aligned}$$

The axis ratio:  $e = 0.50 \pm 0.01$

Position angle:  $61 \pm 5^\circ$

# Parameters of the SBS 1520+530 obtained from the modeling SIS+ $\gamma$

$$\Omega_{\Lambda} = 0.7, \Omega_M = 0.3$$

$$H = 75 \frac{km}{c \cdot Mpc}$$

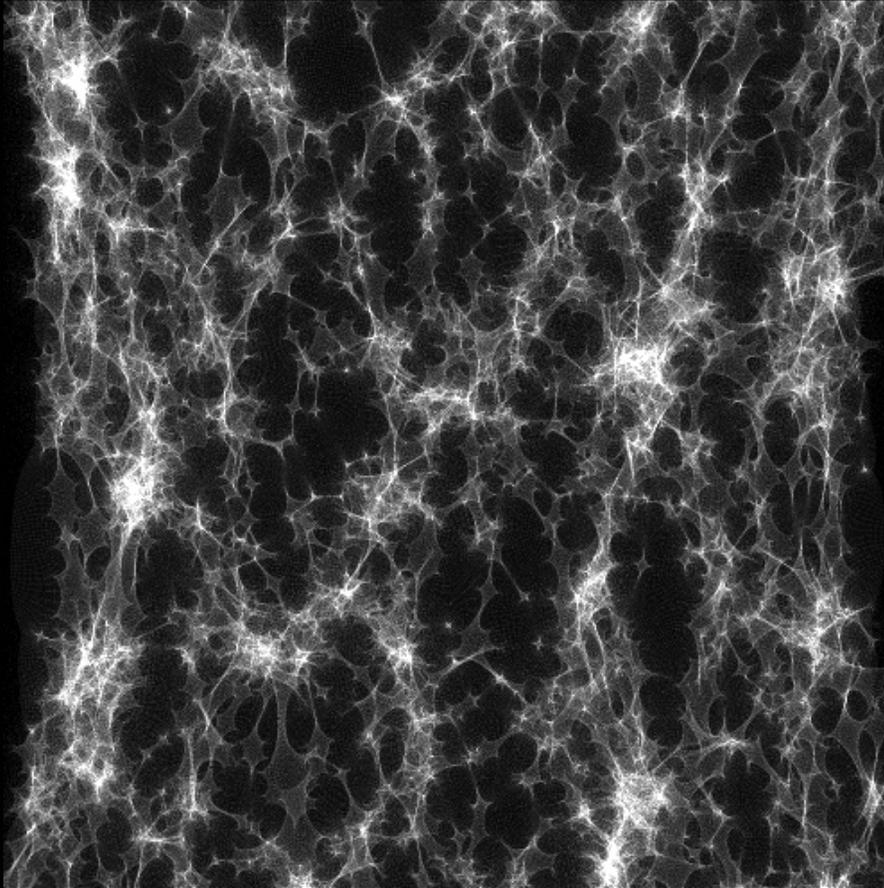

$$D_L = 1389 Mpc, D_{LS} = 789 Mpc,$$

$$D_S = 1624 Mpc$$

$$\theta_E = 0.815'' \quad \sigma_v = 241 \frac{km}{c}$$

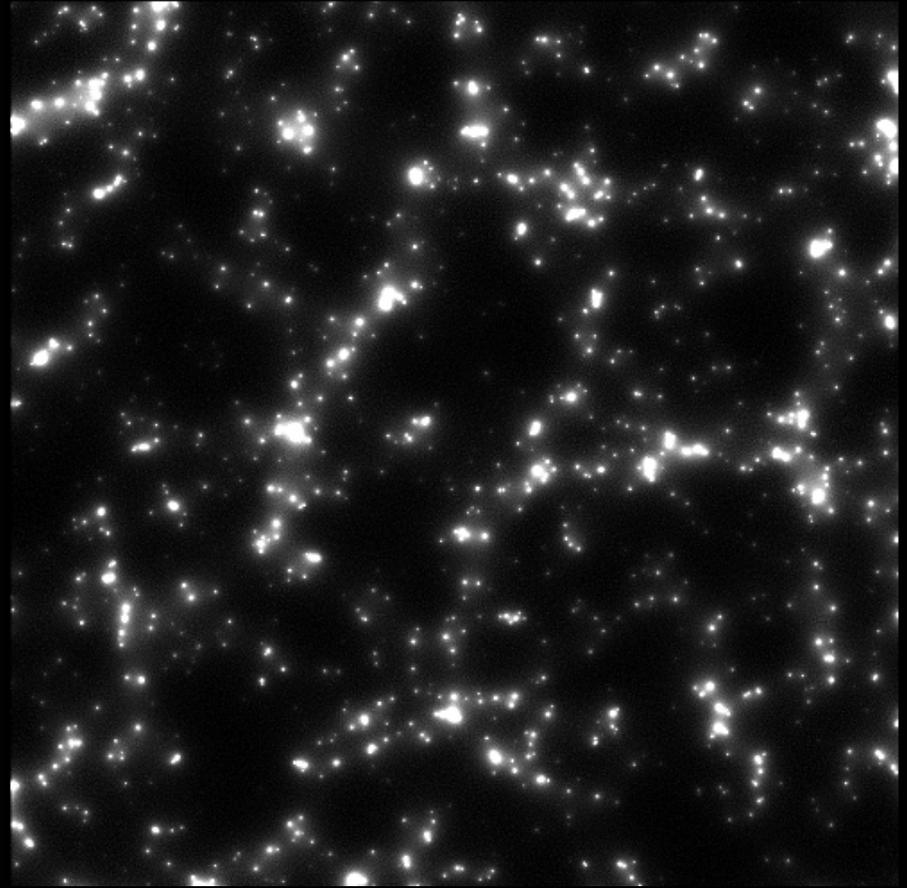

$$\gamma = 0.1$$

# Modeling of a caustic pattern near A,B components of SBS 1520+530

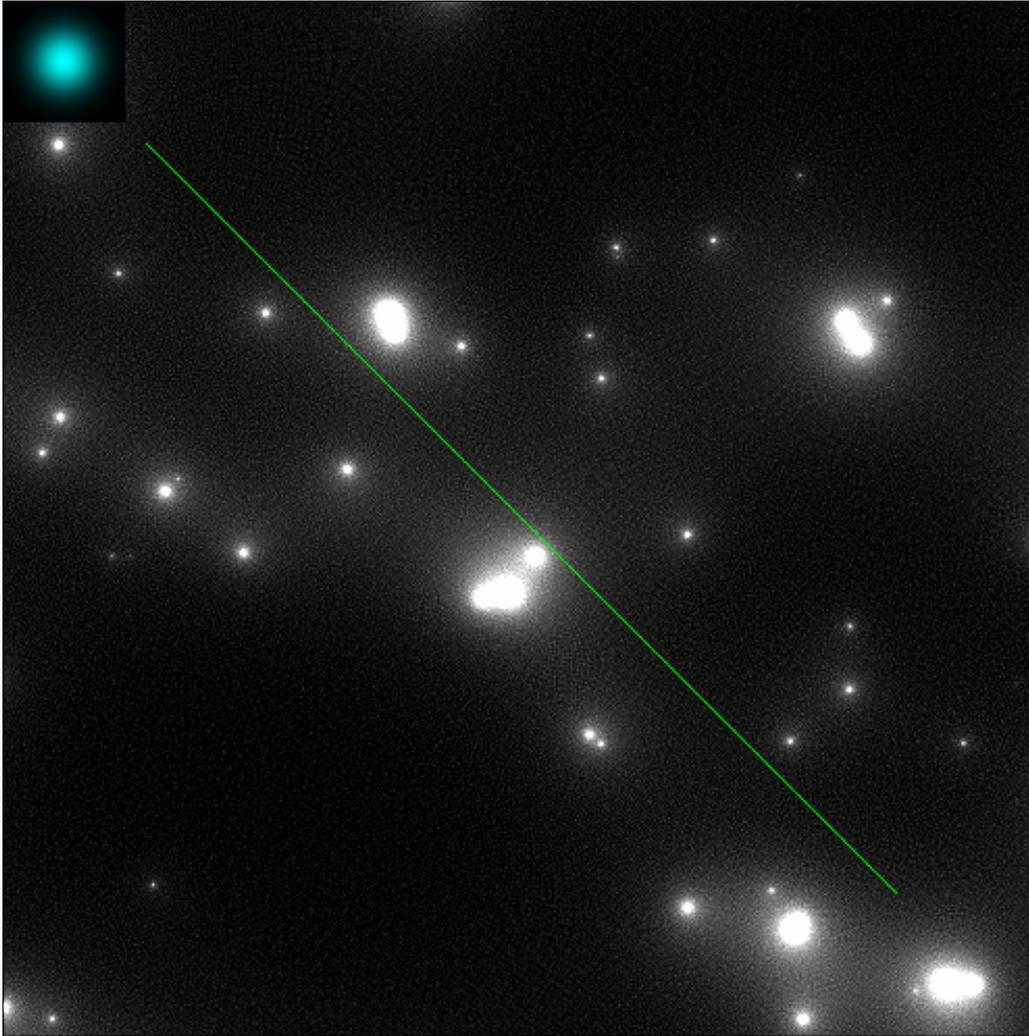

**A**

$$\kappa \approx 0.34, \gamma = 0.1$$

**B**

$$\kappa \approx 1, \gamma = 0.1$$

## Einstein radius of solar mass

$$\theta_M = 2 \cdot 10^{-4} \text{ arcsec}$$

$$\xi_M = 4.1 \cdot 10^{14} \text{ m}$$

If suppose :

$$v_{trans} = 1000 \frac{\text{km}}{c}$$

then an estimate of the time of Einstein ring crossing:

$$\Delta t \approx 25 \text{ years}$$
